Overview

Previous works:

- ▶ Agent Societies
- ▶ Material Agent Societies
- ▶ Elementary Economic Systems in Material Agent Societies

General goal:

- ▶ To show that the conceptual model we call *agent society* supports the specification of *formal semantical models* for social theories (developed in social sciences).
 - ▶ By showing that some particular *theorems* of social theories are valid for some particular *types* of agent societies.

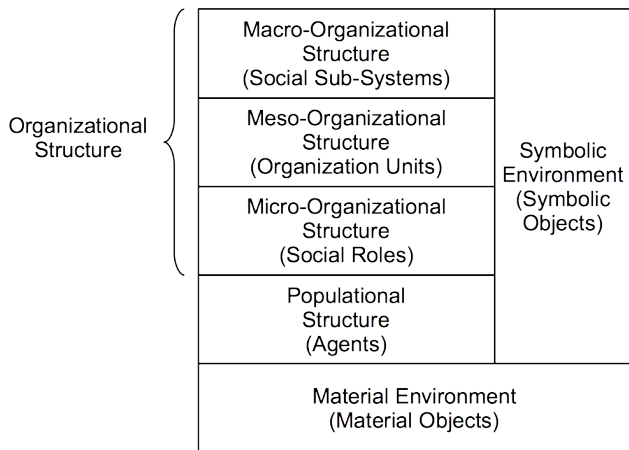

The current work targets theories of *slavery*.

Main Concepts in the Present Paper

- ▶ Masters and Slaves in Chattel Slavery
- ▶ Master-Slave Property Relationship
- ▶ Master-Slave Economic Exchange
- ▶ Slavery-Based Elementary Economic Exchange
- ▶ Slavery-Based Elementary Economic Process
- ▶ Slavery-Based Elementary Economic System
- ▶ Slavery-Supporting Legal System
- ▶ Slavery-Based Material Agent Society

Agent Societies

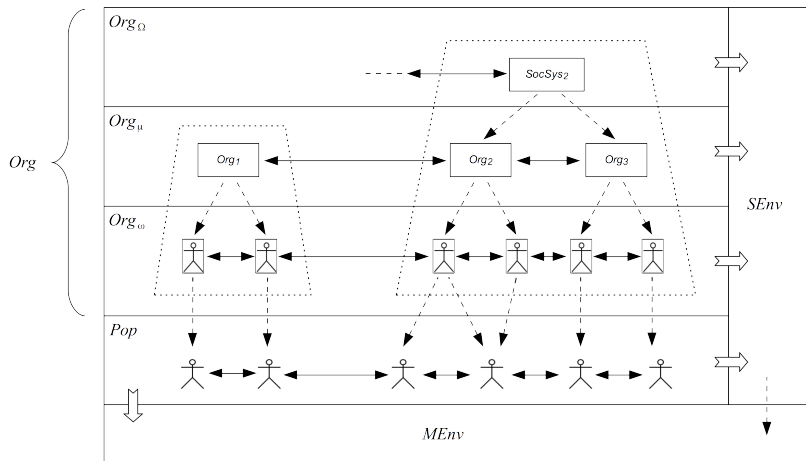

An *organizational model* for multiagent systems:

- supporting core aspects of *social structuration*.

Agent Societies

An *organizational model* for multiagent systems:

- ↔ Interaction
- - - Implementation
- Access

Material Agents and Material Agent Societies

- ▶ **Material agent:**
 - an agent that has a *material body*, requiring *energy* for its operation.
- ▶ **Material agent society:**
 - an agent society whose agents are all material agents.
- ▶ **Energy producer:**
 - a material agent that can *gather energy* from the material environment of the society;
 - possibly producing energy for delivery to other agents.
- ▶ **Energy consumer:**
 - a material agent that does not produce energy for itself.
- ▶ Material agent society **energetically autonomous:**
 - energetically self-sufficient and capable of managing itself the use of energy by its material agents.

Masters and Slaves Chattel Slavery

In a slavery-based material agent society:

- ▶ $MatObj$: the set of *material objects*;
- ▶ $MatAg \subseteq MatObj$;
- ▶ $Master \subseteq MatAg$;
- ▶ $Slave \subseteq MatAg$.

For simplicity, we take that:

- ▶ $Master \cap Slave = \emptyset$;
- ▶ $Master \subseteq EnerCons$;
- ▶ $Slave \subseteq EnerProd$.

Master-Slave Property Relationship

The *property relation* between masters and slaves:

$$\textit{owns} \subseteq \textit{Master} \times \textit{Slave}$$

If $\textit{owns}(\textit{master}_i, \textit{slave}_j)$ then \textit{master}_i can:

- ▶ $\textit{sell}(\textit{slave}_j, \textit{master}_k)$
- ▶ $\textit{lend}(\textit{slave}_j, \textit{master}_k)$
- ▶ $\textit{rent}(\textit{slave}_j, \textit{master}_k)$
- ▶ $\textit{kill}(\textit{slave}_j)$
- ▶ $\textit{free}(\textit{slave}_j)$
- ▶ $\textit{command}(\textit{slave}_j, \textit{cmd})$
- ▶ $\textit{punish}(\textit{slave}_j, \textit{cmd})$

And \textit{slave}_j is supposed to comply with:

- ▶ $\textit{mustexec}(\textit{slave}_j, \textit{cmd}, \textit{master}_i)$

Master-Slave Economic Exchange

Economic exchange with an individual slave:

Also possible, economic exchange with a *group* of slaves.

Slavery-Based Elementary Economic Process

Slavery-Supporting Legal System

The fundamental authorizations:

1. $owns(master_i, slave_j) \Rightarrow$
 $Auth(master_i, command(master_i, anyact, slave_j))$
2. $owns(master_i, slave_j) \wedge mother(slave_j, slave_k) \Rightarrow$
 $Auth(master_i, owns(master_i, slave_k))$
3. $authorized(mag_i, slavecapture) \wedge captured(mag_i, mag_j) \Rightarrow$
 $Auth(mag_i, owns(mag_i, mag_j))$

Slavery-Based Material Agent Society

- ▶ $AgSoc = (Pop, Org, MEnv, SEnv, IMP, ACC)$

where:

- ▶ Pop is the *population* of $AgSoc$;
- ▶ Org is the *organizational structure* of $AgSoc$;
- ▶ $MEnv$ is the *material environment* of $AgSoc$;
- ▶ $SEnv$ is the *symbolic environment* of $AgSoc$, where the society's system of *legal norms* is embedded;
- ▶ IMP is the collection of *implementation relations* between Pop and Org ;
- ▶ ACC is the collection of *access relations* between $Pop \cup Org$ and the environments $MEnv$ and $SEnv$.

Case Study

The theorem examined in the case study:

- ▶ There are *economic conditions* under which it is rational for a society to adopt a slavery-based economic system instead of a free labor-based one.
 - ▶ North, D. C. and Thomas, R. P. (1971). The rise and fall of manorial systems: A theoretical model. *The Journal of Economic History*, 31(4):777–803.

The goal of the study:

- ▶ to formally capture such *economic conditions* within the model of *agent societies*.
